

Luminette

Hardwiring Information

- When hardwiring Luminette Shades, follow the above diagram.
- Luminette Shades **CANNOT** be connected directly to the main power source in the home as this is generally 230 volts. Luminette Shades require **18 volts** of electricity and connecting these via the above diagram and external device, ensures that the correct power voltage is pushed out to each of the shades. This external power supply can be purchased from most electrical stores.
- You can connect a maximum of 5 Luminette's as above. We do not recommend connecting more than this as there is potential for the correct electricity supply to not reach all blinds leading to potential issues.
- It is recommended to cut only the transformer off the main DC Adaptors (supplied with each blind) and to not cut the barrels as the barrels are in place to assist with removing the products in the future if required.
